

Notion Productivity System: 7 Ready-to-Build Templates

RenWork Digital Products

Introduction: The Architecture of Flow

This guide provides the blueprint for a high-performance Notion workspace. We are not just creating isolated pages; we are engineering an ecosystem where data flows logically from capture to execution to reflection. The core philosophy here is **modularity with connectivity**. Each of the seven templates below is a standalone module, but the true power lies in the linking strategy that binds them. To begin, create a new page in your Notion workspace and title it "Master HQ." This will be the central hub. We will build the seven components as separate pages within this workspace, then link them back to "Master HQ."

1. Personal Dashboard

The dashboard is your cockpit. It is not a database; it is a layout of linked views.

****Setup:****

Create a page titled "Dashboard." Inside, create a header section with a callout block for your current focus or affirmation. Below this, add the following linked views (we will create the databases for sections 2 through 7 first, so you can link them later, or create them now and fill in details as we go):

1. ****Today's Top 3 Tasks:**** A linked view of the Task Database (see Section 2). Filter by `Start Date` is Today OR `Deadline` is Today. Sort by `Priority` (High to Low). Limit to 3 items.
2. ****Active Projects:**** A linked view of the Project Database (see Section 2). Filter by `Status` is "In Progress." Sort by `Next Action Due` ascending.
3. ****Quick Capture:**** A simple "To-Do" list property or a small gallery view of the Second Brain (Section 3) filtered by `Tag` is "Inbox."

4. **Habit Streaks:** A gallery or board view of the Habit Tracker (Section 4) showing current streaks.

Linking Strategy:

This page contains no original data. It aggregates data from the other six templates. Ensure each linked view is customized to show only the most relevant properties (e.g., hide "Created Time" on the dashboard for cleanliness).

2. Task + Project Manager

This is the engine of your productivity. It requires two databases: **Projects** and **Tasks**.

Project Database Properties:

- * `Name` (Title)
- * `Status` (Select: Idea, Planning, In Progress, Done, Archived)
- * `Owner` (Person)
- * `Start Date` (Date)
- * `Deadline` (Date)
- * `Progress` (Number, 0-100)
- * `Related Tasks` (Relation to Task Database)
- * `Notes` (Text, for high-level context)

Task Database Properties:

- * `Name` (Title)
- * `Project` (Relation to Project Database)
- * `Status` (Select: Backlog, This Week, Today, Done)
- * `Priority` (Select: High, Medium, Low)
- * `Start Date` (Date)
- * `Due Date` (Date)
- * `Estimate` (Number, in minutes)
- * `Actual Time` (Number, in minutes)
- * `Subtasks` (Self-relation)

Views:

1. **Board View (Kanban):** Group by `Status`. Use for daily task triage.
2. **Timeline View:** Group by `Project`. Use to visualize workload distribution.
3. **List View (Project Detail):** Filter to show all tasks related to the currently selected project.

****Linking Strategy:****

In the Task Database, the `Project` relation is bidirectional. In the Project Database, the `Related Tasks` property will automatically show a list of all tasks tied to that project. Add a rollup property in the Project Database called `Task Count` (Count of Related Tasks) and `Completed Tasks`

(Count of Related Tasks where Status is Done) to automatically calculate progress.

3. Second Brain / Note Vault

This is your knowledge base. It is a single, powerful database.

****Database Properties:****

- * `Title` (Title)
- * `Type` (Select: Note, Article, Idea, Meeting, Resource)
- * `Tags` (Multi-select: Work, Personal, Health, Finance, etc.)
- * `Status` (Select: Inbox, Processing, Reference, Archived)
- * `Source` (URL or Text)
- * `Summary` (Text)
- * `Date Created` (Date)
- * `Related Projects` (Relation to Project Database)
- * `Related Tasks` (Relation to Task Database)

****Views:****

1. ****Gallery View (Home):**** Card view with cover images and description. Filter by `Status` is "Reference."
2. ****Table View (Inbox):**** Filter by `Status` is "Inbox." This is where you dump quick captures.
3. ****Timeline View:**** Group by `Date Created`. Useful for reviewing recent learning.

****Linking Strategy:****

The power here is the `Related Projects` and `Related Tasks` relations. When you read an article relevant to a project, link the note to that project. This ensures that when you open a project page, you see all the research and notes associated with it, not just the tasks.

4. Habit Tracker

A simple, consistent system for tracking daily behaviors.

****Database Properties:****

- * `Habit Name` (Title)

- * `Category` (Select: Health, Productivity, Mindfulness)
- * `Frequency` (Select: Daily, Weekly, Monthly)
- * `Target` (Select: 1x, 2x, 3x per day, etc.)
- * `Current Streak` (Number, manual update or formula)
- * `Last Completed` (Date)
- * `Notes` (Text)

****Views:****

1. ****Board View:**** Group by `Category`. Great for quick visual scanning.
2. ****Table View (Log):**** A daily log. You can create a separate "Daily Log" database, but for simplicity, use a checkbox property called `Completed Today` in this database.
3. ****Calendar View:**** To visualize consistency over time.

****Linking Strategy:****

Keep this database independent to avoid cluttering other views. However, add a `Related Project` relation if a habit is specifically tied to a project (e.g., "Practice Guitar" linked to "Learn Guitar" project).

5. Content Calendar

For creators, marketers, or anyone publishing regularly.

****Database Properties:****

- * `Title` (Title)
- * `Platform` (Select: Blog, Twitter, LinkedIn, YouTube, Newsletter)
- * `Status` (Select: Idea, Draft, Scheduled, Published, Archived)
- * `Publish Date` (Date)
- * `Content Type` (Select: Article, Video, Thread, Image)
- * `Key Message` (Text)
- * `Related Notes` (Relation to Second Brain Database)
- * `Performance Metrics` (Number, optional)

****Views:****

1. ****Calendar View:**** Group by `Publish Date`. This is your primary view.
2. ****Board View:**** Group by `Status`. For workflow management.
3. ****Table View (Ideas Bank):**** Filter by `Status` is "Idea."

****Linking Strategy:****

The `Related Notes` relation is critical. When you have a content idea, it often stems from a note

or article in your Second Brain. Link them. This creates a feedback loop: your consumer inputs (reading) fuel your creative outputs (content).

6. Reading List with Notes

A dedicated system for book consumption and synthesis.

****Database Properties:****

- * `Title` (Title)
- * `Author` (Text)
- * `Status` (Select: To Read, Reading, Finished, DNF)
- * `Rating` (Select: 1-5 stars)
- * `Start Date` (Date)
- * `Finish Date` (Date)
- * `Key Takeaways` (Text or Relation to Second Brain)
- * `Related Projects` (Relation to Project Database)

****Views:****

1. ****Board View:**** Group by `Status`.
2. ****Gallery View:**** For visual appeal, with cover images of book covers.
3. ****Table View (Finished):**** Filter by `Status` is "Finished." Sort by `Finish Date` descending.

****Linking Strategy:****

When you finish a book, create a note in your Second Brain database summarizing it. Link that note

to the Reading List entry. This ensures that the insights from the book are stored in your searchable knowledge base, not just in the reading list entry.

7. Weekly Review System

The meta-process that keeps the system healthy.

****Database Properties:****

- * `Week` (Title, e.g., "Week 22 - 2023")
- * `Date Range` (Date)
- * `Wins` (Text)
- * `Challenges` (Text)
- * `Next Week's Priorities` (Text)
