

Notion Freelancer Dashboard: 5 Client + Project Templates

RenWork Digital Products

Introduction to the Freelancer Command Center

This guide provides the blueprint for a high-performance Notion workspace designed for freelancers

managing up to five concurrent clients. The system relies on relational databases, ensuring that data entered in one template automatically propagates to others, eliminating manual data entry and

reducing the risk of error. You will build five distinct databases: Client CRM, Project Tracker, Invoice + Payment Log, Time Log, and Content Vault. Each database serves a specific function but

connects to the others through Relations and Rollups.

Template 1: Client CRM

The Client CRM is the central hub for all client relationships. Start by creating a new Database of type "Table" and name it "Client CRM".

****Properties:****

- **Name****: Title. The client's company name.
- **Status****: Select. Options: Lead, Active, Paused, Churned.
- **Tier****: Select. Options: Platinum, Gold, Silver. Use this to prioritize high-value clients.
- **Contact****: Text. Primary point of contact's name and email.
- **Rate****: Number. Format: Currency. This is the base hourly or project rate.
- **Contract Signed****: Checkbox. Indicates if a legal agreement is in place.
- **Linked Projects****: Relation. Connect to the "Project Tracker" database. Allow multiple selection.

****Views:****

- **Active Clients****: Filter where Status is "Active" or "Lead". Sort by Tier (Platinum first).

2. **Pipeline**: Filter where Status is "Lead". Sort by Last Contact (add a "Last Contact" Date property if not already present, or use Created time).
3. **By Tier**: Group by Tier. This helps you see your portfolio balance.

Automation Ideas:

- * Use a "Button" property to quickly mark a Lead as "Active" and prompt you to create a new project in the Project Tracker.
- * Add a formula property: ``if(prop("Contract Signed"), "Signed", "Needs Contract")`` to highlight administrative gaps.

Template 2: Project Tracker

This database tracks the lifecycle of specific work engagements. Create a new Table database named "Project Tracker".

Properties:

1. **Name**: Title. Project name (e.g., "Website Redesign").
2. **Client**: Relation. Connect to "Client CRM". Allow single selection.
3. **Status**: Select. Options: Planning, In Progress, Review, Completed, Archived.
4. **Deadline**: Date. The final delivery date.
5. **Deliverables**: Multi-select. Options: Design, Code, Copy, Video, Strategy.
6. **Invoiced**: Checkbox. Has an invoice been generated?
7. **Paid**: Checkbox. Has the invoice been cleared?

Views:

1. **Active Projects**: Filter where Status is "Planning", "In Progress", or "Review". Sort by Deadline (ascending). This is your daily priority view.
2. **Per Client**: Group by Client. This allows you to see all current work for a specific account at a glance.
3. **Kanban by Status**: Switch view type to Board. Group by Status. Drag and drop projects to update their status.

Connection Logic:

The "Client" relation here pulls data from the CRM. If you update a client's status to "Churned" in the CRM, you can later add a formula in the Project Tracker to flag any "In Progress" projects associated with churned clients as potential risks.

Template 3: Invoice + Payment Log

Financial tracking is critical. Create a Table database named "Invoice Log".

****Properties:****

1. ****Invoice Number****: Title. Format: INV-2023-001.
2. ****Client****: Relation. Connect to "Client CRM".
3. ****Project****: Relation. Connect to "Project Tracker". This ensures invoices are tied to specific work.
4. ****Amount****: Number. Currency.
5. ****Due Date****: Date.
6. ****Status****: Select. Options: Draft, Sent, Paid, Overdue, Cancelled.
7. ****Payment Date****: Date. When the money actually hit your bank.

****Views:****

1. ****Unpaid****: Filter where Status is "Sent" or "Overdue". Sort by Due Date.
2. ****By Client****: Group by Client. Use a Rollup property (see Section 6) to sum the total invoiced amount per client.
3. ****Monthly Income****: Switch view type to Calendar. Group by Month. This gives you a visual overview of cash flow.

****Automation Ideas:****

- * Add a Formula property for "Days Overdue": ``if(prop("Status") == "Overdue", dateBetween(now(), prop("Due Date"), "days"), 0)``.
- * Use a Filter to create a "Cash Flow Forecast" view showing invoices due in the next 30 days.

Template 4: Time Log

Track your hours to ensure accurate billing and identify profitability. Create a Table database named "Time Log".

****Properties:****

1. ****Task****: Title. Description of the work (e.g., "Logo Revamp").
2. ****Project****: Relation. Connect to "Project Tracker".
3. ****Start Time****: Date/Time.
4. ****End Time****: Date/Time.
5. ****Duration****: Formula. ``dateBetween(prop("Start Time"), prop("End Time"), "hours")``.
6. ****Billable****: Checkbox. Distinguish between client work and admin tasks.

****Views:****

1. ****By Project****: Group by Project. Use a Rollup to sum the "Duration" for each project.
2. ****Weekly Total****: Group by Week (create a "Week" formula property if needed, or use the Date grouping). Sum the Duration.
3. ****Unbilled Hours****: Filter where Billable is true AND the linked Project's Status is not "Completed". Sort by Duration descending. This highlights work you've done but haven't invoiced yet.

Template 5: Content and Deliverable Vault

This is your repository for all files and assets. Create a Table database named "Deliverables".

****Properties:****

1. ****Name****: Title. File name or asset description.
2. ****Type****: Select. Options: File, Link, Document, Image.
3. ****Project****: Relation. Connect to "Project Tracker".
4. ****Status****: Select. Options: Draft, In Review, Approved, Delivered.
5. ****Due****: Date. When the client expects this asset.
6. ****Version****: Number. Increment for revisions.
7. ****File Link****: URL or Files. Store the direct link to the file (Dropbox, Drive, etc.).

****Views:****

1. ****By Project****: Group by Project. This acts as a mini-portfolio for each engagement.
2. ****Needs Review****: Filter where Status is "In Review". Sort by Due Date. Focus here first in your morning routine.
3. ****Delivered****: Filter where Status is "Delivered". Sort by Date Descending. Useful for case studies and past work references.

System Integration: Relations and Rollups

The power of this dashboard lies in the connections. Here is how to link them for a seamless experience:

1. ****Client to Project****: In "Project Tracker", the "Client" property is a Relation to "Client CRM". In "Client CRM", the "Linked Projects" property is the reverse relation. This allows you to open a Client page and see a list of all their projects without leaving the page.

2. ****Project to Invoices****: In "Invoice Log", the "Project" property relates to "Project Tracker". In "Project Tracker", add a Relation property called "Invoices" pointing to "Invoice Log". Then, add a ****Rollup**** property in "Project Tracker" called "Total Invoiced". Configure it to:
 - * Relation: Invoices
 - * Property: Amount
 - * Calculation: Sum
 - * ***Result***: Every project automatically shows the total money invoiced for it.
3. ****Project to Time****: In "Time Log", the "Project" property relates to "Project Tracker". In "Project Tracker", add a Relation "Time Entries" and a ****Rollup**** "Total Hours Logged" (Sum of Duration).
 - * ***Pro Tip***: Add a Formula in "Project Tracker": ``prop("Total Hours Logged") * prop("Client Rate")`` (referencing the client's rate via a Rollup from the Client relation). This calculates the estimated value of work done so far.
4. ****Project to Deliverables****: In "Deliverables", the "Project" property relates to "Project Tracker". In "Project Tracker", add a Relation "Deliverables" and a ****Rollup**** "Items Pending" (Count of items where Status is not "Delivered").

Daily Workflow

Use this specific sequence to manage your day using only these templates.

****Morning Open (9:00 AM)****

1. Open the ****Project Tracker**** view "Active Projects".
